

2007 PARKER LAKE SNAPSHOT

In 2007, the Parker Lake Association, with the assistance of the Adams County Land & Water Conservation Department, started drafting a lake management plan to be submitted to the Wisconsin Department of Natural Resources for possible approval.

This process involved two public meetings and the participation of several lake citizens in writing the plan.

The average summer water clarity in 2007 was 13.4 feet (very good). No water temperature readings were taken.

The average summer total phosphorus level was down slightly to 22 micrograms/liter (good).

The summer average chlorophyll-a level was still low at 3.5 micrograms/liter.

These readings were taken by Parker Lake Association officers, with the assistance of Adams County LWCD staff.

The Parker Lake Association had the Eurasian watermilfoil population treated chemically this summer, with highly positive results.
